So this week I attempted something new and I believe it worked. I printed out my time estimation sheet early on in the week and really started to notice a pattern in time spent and tried to figure out how I could optimize it. This week I was able to complete all of my assignments on time faster than I anticipated, so instead of just getting off once I was completed I spent the time watching Lynda videos on different web languages that I am weak in such as JavaScript and JQuery. During this week I was able to get a semi-working jQuery form for a friend's website with some debugging already planned out for this next week.

I think by allocating time better and providing myself with better time management I am able to accomplish more and keep focused. I think I have improved a lot with judging time and allocation of my research and projects. I was able to align some projects that I have been working on aside of my homework that way I could do some of the project and some homework. This is going to further expand my abilities with home work.
